

ECO STATEMENT FOR PAREXDAVCO AUSTRALIA

At ParexDavco Australia we are aware of our responsibility to the environment and are committed to using eco-friendly and recycled materials in our products and processes, whenever possible. Many of our products are already certified that they are low VOC.

Our on site R&D laboratory is continually assessing and developing our products to ensure that they are efficient and intelligently designed without compromising performance. These efficiencies are important to ensure our products are as eco-friendly as possible by using state of the art raw materials in our formulations. 100% of the rubber crumb used in our adhesives is recycled tyres, which assists in dramatically reducing one of the world's largest waste disposal problems - the dumping of old tyres. It also reduces the need for sand in our products and, in turn, the impact that sand mining has on our environment. Our research scientists work closely with our suppliers and colleagues on a global level including Europe, North & South America and S.E. Asia, to stay at the forefront of technological developments and ensure that we are equal to the world's best practices when it comes to eco-friendly technology in our field.

Freight movements are limited by having several regional production facilities across the country. In addition, as part of the laboratory's function, we assess alternative local raw materials to help ensure continuity of supply and minimise raw material shipping.

All waste water in our manufacturing facilities is treated on-site. As part of our continuous improvement all our processes are constantly assessed including packaging, production efficiencies, transportation, waste and recycling.

We also continue to educate, train and motivate our employees to conduct their activities in an environmentally responsible manner as well as advise and, where relevant, educate customers and the public in the safe disposal of products and packaging provided.
